

So this is a demo of our app

You can see we are signed into a profile already named James

Here James can find procedures or find hospitals

Lets try to find a procedure

James can search here, lets see whats available for CT Scans

Here the results show location, average cost, contact information, and review data.

By clicking on a location James can see specific user written reviews that can help him decide on his procedure

Going back to the menu, James can use the find hospital feature to locate nearby hospital locations.

Similarly to the procedure search, results when searching hospitals will include location address, contact information, and review data.

The user can click on a hospital to read more in-depth information about reviews.

Thank you
